

MSE Field

Technician walkthrough

Every screen in the field app, in order. How to sign in, log a unit, submit a job, handle stuck uploads, and what admins see. A few text-only callouts cover things that only make sense in motion (the AI nameplate reader, the upload queue).

Generated May 21, 2026

Maryland Smart Energy — internal use

1. Sign in

Open the app and tap your 4-digit PIN. The pad submits automatically once you enter the fourth digit — no Enter button.

Sessions last 30 days. You can sign out anytime via the icon in the top-right of every screen.

If you get the wrong PIN, the dots shake. Hit the backspace icon to clear and try again.

2. Jobs home

Your daily home screen. Every job you're on from the last 7 days appears here.

Tap a job tile to open it, the red New job button to start a new one, or pull down to refresh.

Admins also see a dashboard icon (the 4-square grid) in the top-right.

3. New job — blank form

Three things to fill in: business name, utility territory, and crew on site.

Business name is the property or company (e.g. "Towson Office Plaza") — not the contact person you're talking to.

Crew defaults to just you, the logged-in tech. Tap additional teammates if anyone else is on site.

4. New job — filled in

What it looks like once everything's picked. Selected utility lights up navy; selected crew names get a checkmark.

Tap Create job at the bottom — the app drops you into the new job's detail screen ready for the first unit.

5. Job detail

Inside a job. Tap Add unit for each HVAC unit you serviced — units stack up below as you add them.

The Submit job button stays disabled until at least one unit is logged. Once you've added units, it lights up red.

Use the back arrow (top-left) to return to the jobs list. The pencil icon edits the job's name or territory.

6. Add unit — pick a type

First choose what kind of unit you're servicing. Each type has its own photo checklist:

PTAC / Ductless — 3 photos (pre, post, nameplate). Split System — 11 photos (outdoor 3 sides + air handler).

RTU-Small / Medium / Large — 7 photos each (coil 1 + 2 before/after, filter before/after, nameplate).

 **MSE Field**  

 **Add unit**

Unit type *

PTAC / Ductless
incl. water-source HP,
VRV/VRF · 3 photos

Split System
3 outdoor sides + air
handler · 11 photos

RTU · Small
2 coils · 7
photos

RTU · Medium
2 coils · 7
photos

RTU · Large
2 coils · 7
photos

Save unit · 0/0 required photos

7. Add unit — PTAC checklist

Snap the nameplate FIRST. The AI auto-fills make / model / serial from the photo within a few seconds (more on the next page).

Then capture pre-service, post-service, and (optional) filter shots. Each red asterisk is a required photo before you can save.

Add a few extra photos for things worth flagging — gauges, problem areas, parts you swapped. Save unit when the checklist's full.

Notes

Anything worth flagging — issues found, recommendations, parts needed.

8. AI nameplate reading

When you snap a nameplate photo, the app sends it to Claude AI to read the text. Within 3–5 seconds, make / model / serial appear in the fields below — no typing needed.

A small banner above the fields tells you what happened: a gold sparkle means high confidence (the AI is sure); a red flag means medium confidence (glance over it and fix anything wrong); a muted note means the photo was too blurry — retake or type manually.

If you retake the nameplate later, it re-reads automatically. The AI only overwrites fields you haven't already edited by hand — anything you typed yourself stays safe.

Cost-wise this runs about half a cent per nameplate, paid through MSE's Anthropic account. No tech action needed.

It also works fully offline — the photo queues up like any other and the OCR fires once you're back online.

Tip

Get the nameplate centered, well-lit, and in focus. The AI handles glare and angled shots well but still works best on a head-on shot with the full label in frame. If the photo's blurry, retake — the OCR will re-fire automatically.

9. Submitting a job

When you're done capturing units, tap Submit job on the job detail screen — it brings you here.

Crew on site is pre-filled from what you picked at job creation. Tap Edit if anyone left mid-day or extra hands joined.

Tap the red Submit job button at the bottom. The app finalizes the job server-side and drops you back at the jobs list with a green "submitted" confirmation.

Photos that haven't finished uploading yet keep uploading in the background — submission isn't blocked on a perfect upload queue.

10. Job submitted

What you see right after you submit. The green banner across the top confirms the dispatch was logged.

The toast fades after a few seconds. The job itself drops off the active list once everything's wrapped — usually the same day.

An automated PDF service report is built in the background and saved to the customer's Drive folder once all photos finish uploading. Admins can resend that report from the dashboard.

11. Photos uploading & retries

Right after you capture a photo it goes into a local queue that uploads in the background. You'll see a small "X pending" pill next to your name in the header — that's the upload counter.

Tap the pill to open the queue inspector. It shows every photo that's still in flight, plus any draft jobs / units waiting to sync because the tech was offline when they were created.

If a photo's been stuck more than a minute, the worker auto-retries it. After 12 failed tries it surfaces a red error chip; tap the circular arrow next to it to force another attempt, or tap "Retry everything" at the top of the inspector to reset every stuck item at once.

Photos stay safe on the phone even after they upload — they're kept locally as a 14-day backup. Tap the floppy-disk icon to pin a specific photo for indefinite local retention.

Going offline mid-job is fine. The app keeps capturing into the queue and will drain it the next time you're back on cell or WiFi. Job submission also works offline — the dispatch will sync when connectivity returns.

Tip

Don't sweat the upload counter. Photos are safe on the phone even before they reach the cloud — losing service won't lose your work. Just keep capturing; the queue drains itself.

12. Admin dashboard

Admins only. Per-tech rollup of the last 7 days at the top — pay, units, last seen location.

Photo audit lists any unit whose photos are still missing — tap Edit to fix it before the customer report goes out.

Recent submissions shows the last 10 dispatches with their PDF status. Re-render builds a fresh PDF (use this if you fixed photos after the fact). Send report emails the PDF to a customer — bring up the email field and tap Send.
